Relational Database Challenges

An Interesting Defect Report

Database Server Crashes

When you run a complex query against Microsoft SQL Server 2000, the SQL Server scheduler may stop responding. Additionally, you receive an error message that resembles the following: **Date Time server Error: 17883 Severity: 1, State: 0 Date Time server Process 52:0 (94c)** ...

Relational Database Challenges

An Interesting Defect Report

Input-Dependent Defect

This problem occurs when one or more of the following conditions are true: The query contains a UNION clause or a UNIONALL clause that affects many columns. The query contains several JOIN statements. The query has a large estimated cost. **BUG 473858 (SQL Server 8.0)**

Conclusion 000 000

Relational Database Challenges

Real-World Defective Database Application

The Risks Digest, Volume 22, Issue 64, 2003 Jeppesen reports airspace boundary problems

About 350 airspace boundaries contained in Jeppesen Nav-Data are incorrect, the FAA has warned. The error occurred at Jeppesen after a software upgrade when information was pulled from a database containing 20,000 airspace boundaries worldwide for the March NavData update, which takes effect March 20.

Allegheny College

Database Applications

Conclusion 000 000

Relational Databases

Structured Query Language

The *structured query language* (SQL) is an established standard and a query and manipulation language for *relational database management systems* (RDBMS)

Kapfhammer

Allegheny College

Database Applications

Conclusion 000 000

Relational Databases

Structured Query Language

The *structured query language* (SQL) is an established standard and a query and manipulation language for *relational database management systems* (RDBMS)

```
A schema is a collection of table definitions:
CREATE TABLE person (
id INT,
name VARCHAR(100) NOT NULL,
age INT(3),
PRIMARY KEY (id)
```

Kapfhammer

Allegheny College
Database Applications

Conclusion 000 000

Relational Databases

Structured Query Language

The *structured query language* (SQL) is an established standard and a query and manipulation language for *relational database management systems* (RDBMS)

The data manipulation language supports several operations:

SELECT name FROM person WHERE age >= 30 AND age <= 40

Kapfhammer

Allegheny College

Database Applications

Conclusion 000 000

Relational Databases

Structured Query Language

The *structured query language* (SQL) is an established standard and a query and manipulation language for *relational database management systems* (RDBMS)

The *data manipulation language* supports several operations:

UPDATE person SET name = Jan WHERE id = 2

Kapfhammer

Allegheny College

Database Applications

Conclusion 000 000

Relational Databases

Structured Query Language

The *structured query language* (SQL) is an established standard and a query and manipulation language for *relational database management systems* (RDBMS)

The data manipulation language supports several operations:

INSERT INTO person (id, name, age) VALUES (1, John, 38)

Kapfhammer

Allegheny College

Database Applications

Conclusion 000 000

Relational Databases

Structured Query Language

The *structured query language* (SQL) is an established standard and a query and manipulation language for *relational database management systems* (RDBMS)

The *data manipulation language* supports several operations:

DELETE FROM person WHERE id = 2

Traditional Invariant Detection

Invariants

Definition

An *invariant* is a mathematical property that holds through some set of transformations

Motivating Examples

•
$$|x| \ge 0$$

• $\frac{C}{d} = \pi$

Kapfhammer

Allegheny College

Database Applications

Conclusion 000 000

Empirical Results

Spurious Invariants

Spurious Invariants

• Vacuous invariants reflect a meaningless relationship.

- patients.phone1 <= patients.BloodType</pre>
- patients.lastName >= patients.address1
- cptcodes.Description != cptcodes.Attribute

• Lack-of-data invariants result from limited data samples.

- mntnr.login == "mntnt"
- inetnum.changed == "2006-10-14 16:21:09"
- person.name one of { "no name company",

"persona non grata"

Empirical Results

Schema Modification

Using Dynamic Invariants

- Some invariants can be enforced by the schema definition
- Schema enforcement:
 - Provides a stronger assurance of data integrity than application enforcement
 - Enables easy long-term maintenance of the program and the relational database
- Analyze enforceable invariants:
 - · Already enforced by the schema
 - Suggest modification to enforce the invariant

Empirical Results

Empirical Conclusions and Future Research

Conclusions

- Meaningful invariants may be mined from both relational databases and database applications
- Invariant quality depends on existence of diverse data
- Data integrity may be enhanced by using invariants for modification of the database's schema

Future Research

- Invariants between multiple tables
- Invariants for individual queries
- Explore additional client applications

Dynamic Invariants

Conclusion

Database-Aware Method

Conclusion

Conclusion

- Databases are widely used in real-world applications
- Database applications have complex state and structure
- Programmers often encode constraints in program source
- Dynamic invariant detection reverse engineers constraints
- Detected invariants are meaningful and enforceable

Future Work

- Further empirical studies of dynamic invariants
- Implement and evaluate several client applications
