

CMPSC 441
Principles of Distributed Systems
Spring 2016

Examination 2 Study Guide

Delivered: Tuesday, April 12, 2016

Examination: Tuesday, April 19, 2016, 9:30 am

Introduction

This course will have its second examination on Tuesday, April 19, 2016 from 9:30 to 10:45 am. The examination will be “closed notes” and “closed book” and it will cover the following content. Please review the “Course Schedule” on the Web site for the course to see the content and slides that we have covered in these modules. You may post questions about this material to Slack.

- Chapter Ten in DSPP (i.e., distributed object-based systems).
- Chapter Eleven in DSPP (i.e., distributed file systems).
- Chapter Twelve in DSPP (i.e., distributed web-based systems).
- Your class notes, class activities, lecture slides, and the first three laboratory assignments.
- Knowledge of the basic commands necessary for using the Ubuntu operating system, `git` and Bitbucket; basic understanding of how to use \LaTeX and Markdown for scientific writing.

The examination will include a mix of questions that will require you to draw and/or comment on a diagram, write a short answer, explain and/or write a source code segment, or give and comment on a list of concepts or points. The emphasis will be on the following list of illustrative subjects. Please note that this list is not exhaustive — rather it is designed to suggest representative topics.

- A basic understanding of object-oriented programming principles and the various ways in which objects are implemented and used in a distributed system (e.g., remote objects).
- The ways in which remote method invocations occur in a distributed object-based system.
- The trade-offs inherent in approaches to performing remote method calls (e.g., static vs. dynamic).
- The key features associated with distributed computing in the Java programming language.
- The upload/download and remote access model for accessing files in a distributed file system.
- The necessary details concerning the implementation and use of distributed file systems (e.g., a basic system architecture and a list of file system operations that must be supported).
- The ways in which a distributed file system could support distributed computing on a cluster.
- The implementation innovations necessitated by the creation of distributed file systems.
- The semantics for accessing files in distributed and local file systems (e.g., UNIX or session).
- All of the key terms associated with distributed web-based systems (e.g., “MIME type”).
- Implementation details for both web servers and web clients (e.g., rendering and caching).
- Communication techniques used in web-based distributed systems (e.g., HTTP operations).
- Lessons learned from the laboratory assignments in which you implemented and experimentally evaluated distributed systems either individually or in a team-based setting.

Examination Policies

Minimal partial credit may be awarded for the questions that require a student to write a short answer. You are strongly encouraged to write short, precise, and correct responses to all of the questions. When you are taking the examination, you should do so as a “point maximizer” who first responds to the questions that you are most likely to answer correctly for full points. Please keep the time limitation in mind as you are absolutely required to submit the examination at the end of the class period unless you have written permission for extra time from a member of the Learning Commons. Students who do not submit their examination on time will have their overall point total reduced. Please see the course instructor if you have questions about any of these policies.

Review the Honor Code

Students are required to fully adhere to the Honor Code during the completion of this examination. More details about the Allegheny College Honor Code are provided on the syllabus. Students are strongly encouraged to carefully review the full statement of the Honor Code before taking this test.

The following provides you with a review of Honor Code statement from the course syllabus:

The Academic Honor Program that governs the entire academic program at Allegheny College is described in the Allegheny Academic Bulletin. The Honor Program applies to all work that is submitted for academic credit or to meet non-credit requirements for graduation at Allegheny College. This includes all work assigned for this class (e.g., examinations, laboratory assignments, and the final project). All students who have enrolled in the College will work under the Honor Program. Each student who has matriculated at the College has acknowledged the following pledge:

I hereby recognize and pledge to fulfill my responsibilities, as defined in the Honor Code, and to maintain the integrity of both myself and the College community as a whole.

Strategies for Studying

As you study for this examination, you are encouraged to form study groups with individuals who were previously, during a laboratory session, a member of one of your software development and empirical study teams. You can collaborate with these individuals to ensure that you understand all of the key concepts mentioned on this study guide. Additionally, students are encouraged to create a Slack channel that can host questions and answers that arise as you continue to study for the test. Even though the course instructor will try to, whenever possible, answer review questions that students post in this channel, you are strongly encouraged to answer the questions posted by your colleagues as this will also help you to ensure that you fully understand the material.

When studying for the test, don't forget that the Web site for our course contains mobile-ready slides that will provide you with an overview of the key concepts that we discussed in the first modules. You can use the color scheme in the slides to notice points where we, for instance, completed an in-class activity, discussed a key point, or made reference to additional details available in the DSPP textbook. Finally, students are strongly encouraged to schedule a meeting during the course instructor's office hours so that we can resolve any of your questions about the material and ensure that you have the knowledge and skills necessary for doing well on this examination. Remember, while the test is taken individually, your review for it can be done collaboratively!
